

Phase A: Wing Coordinator Persistence

HighTowers-Web - Brief for Director of Operations

New Mexico Wing - Low Level Route tower surveys

Purpose

HighTowers-Web supports crew mission work (flight plans, tower analysis, reports, content packs) and a Coordinator Survey Console for sortie planning when teams or weather change. Today, coordinator plans are not saved on the server - they exist only in the coordinator browser until re-entered.

Phase A adds wing-level persistence for coordinator scenarios so replanning does not mean starting over, and published sortie briefs can be reopened and shared by reference.

Problem Phase A solves

Weather / roster change	Reopen same scenario, change teams, publish updated brief
Common reference	Published scenario links flight plan and sortie assignments
New laptop / refresh	Scenario saved on wing API (Railway), not only browser

Phase A does not yet solve: pilot sets up mission on one device and airborne photographer completes analysis on another (Phase C). Training SOP: crew close-out stays on one browser profile until Phase C.

What we will build

- Save coordinator scenario (flight plan, team airports, mode, budget, sortie results).
- Load and list scenarios by route or campaign for the season.
- Version or republish when roster or weather changes (audit trail).
- Shareable brief for aircrew (waypoint ranges, offsets, ferry legs).
- Hosting: GitHub Pages (app) + Railway API (SQLite) - same stack as today.

Out of scope: syncing crew missions, tower photos, or reports across devices (Phase C).

Training and interim SOP

- Coordinator saves and republishes scenarios after roster or weather changes.
- Crew setup and post-flight analysis: same browser/device when pilot and photographer differ - until Phase C.
- Artifacts of record remain: Air Force PDF, content pack ZIP, wing folder storage.
- Live app: <https://gvdurfee.github.io/HighTowers-Web/>

Why Phase A now (not Phase C)

Phase A	Moderate effort, low risk, immediate coordinator replanning value
Phase C	Larger effort, crew sync and photos; after training feedback

Recommendation

Approve Phase A as the next development increment: persist coordinator survey scenarios on the wing API so operations can rely on replanning and shared briefs when the app becomes mandatory post-training. Defer Phase C until training surfaces priority improvements.

Decision requested

- [] Approve Phase A scope for development after training (or in parallel if urgent).
- [] Confirm interim SOP: crew data single-browser until Phase C.
- [] Use training to log enhancement requests for post-Phase A prioritization.
